Cases Simulation Results

Application

-Variable Selection

Variable Selection

Recent improvements in data collection technologies give rise to complex regression problems where the number of candidate predictor variables explaining the response variable may be very large.

In most of these regression problems the main task is to select the most influential predictors explaining the response, and removing the others from the model.

These problems are usually referred to as variable selection problems in the statistical literature.

-Variable Selection

-Subset Selection Methods

Subset Selection

Consider the linear regression model

$$Y = X\beta + \epsilon, \tag{1}$$

where Y is a vector of length n representing the response variable, X is an n by p matrix representing the predictor variables, β is a vector of length p containing regression coefficients, and ϵ is a vector of length n containing independent normal noise terms.

The essential goal in variable selection is to divide X into the set of active terms X_A and the set of inactive terms X_I .

-Variable Selection

-Subset Selection Methods

Issues:

- Comparison Criterion for two candidates of X_A.
 - Akaike Information Criterion: $AIC = n \log (RSS/n) + 2p$
 - Bayesian Information Criterion: $BIC = n \log (RSS/n) + p \log n$
 - Computationally Intensive Comparison Criteria: k-Fold Cross-Validation, etc.
- Computational Method. If there are p candidate predictors, there are 2^p − 1 possible candidates for X_A. Ex: When p = 20 → 1,048,575 possible models to check.
 - Stepwise Methods (Forward and Backward).
 - Branch-and Bounds, Leaps-and-Bounds.
 - Stagewise Methods.

-Variable Selection

- Shrinkage Methods

Shrinkage Methods

The discrete nature of subset selection methods may lead to high variance in some situations.

Due to their continuous nature, *shrinkage methods* may provide an alternative to the subset selection methods.

- Ridge Regression (Hoerl and Kennard, 1970a,b)
- Lasso (Tibshirani, 1996)
- LARS (Efron et. al., 2004)

Preliminaries

- Measures of Dependence

Dependence Measures

In virtually any field of statistics, there is a need for measuring the dependence between random variables.

According to Rényi (1959), a measure of dependence should satisfy the following postulates.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Preliminaries

- Measures of Dependence

Rényi (1959) Postulates for Measures of Dependence

A) $\delta(X, Y)$ is defined for every pair X, Y neither of which is constant with probability 1.

B)
$$\delta(X, Y) = \delta(Y, X).$$

$$\mathsf{C}) \ \mathsf{0} \leq \delta(X, Y) \leq 1.$$

D) $\delta(X, Y) = 0$ if and only if X and Y are independent.

E) $\delta(X, Y) = 1$ if either X = g(Y) or Y = f(X), where $g(\cdot)$ and $f(\cdot)$ are Borel-measurable functions.

F) If the Borel-measurable functions $g(\cdot)$ and $f(\cdot)$ map the real axis in a one-to-one way to itself, then $\delta(f(X), g(Y)) = \delta(X, Y)$. G) If the joint distribution of X and Y is normal, then $\delta(X, Y) = |R(X, Y)|$, where R(X, Y) is the correlation coefficient of X and Y.

Preliminaries

- Maximal Correlation

Maximal Correlation

The maximal correlation S between two random variables (X, Y) is defined as

$$S(X,Y) = \sup_{f,g} \rho(f(X),g(Y)),$$

where ρ denotes the classical correlation coefficient, and the supremum is taken over all functions of X and Y with finite and positive non-zero variance.

If there exist some f_0 and g_0 such that $S(X, Y) = \rho(f_0(X), g_0(Y))$, we say that the maximal correlation of X and Y can be attained.

- Preliminaries
 - -Maximal Correlation

Maximal Correlation satisfies all 7 postulates listed by Rényi (1959).

Product Moment Correlation satisfies B, C, and G only.

Gebelein (1941) Rényi (1959) Csáki and Fisher (1963) Breiman and Friedman (1985) Koyak (1987) Sethuraman (1990) Dembo et. al. (2001) Bryc et. al. (2005) Yenigun et. al. (2011)

Preliminaries

- Distance Correlation

Distance Correlation

Consider random vectors X in \mathbb{R}^p and Y in \mathbb{R}^q . The characteristic functions of X and Y are denoted by f_X and f_Y , respectively, and the joint characteristic function of X and Y is $f_{X,Y}$. The distance covariance between X and Y is

$$V^{2}(X,Y) = \|f_{X,Y}(t,s) - f_{X}(t)f_{Y}(s)\|^{2}.$$
 (2)

See Szekely, Rizzo, Bakirov (2007) for the norm $\|\cdot\|$.

Preliminaries

- Distance Correlation

Similarly, the distance variance of X is

$$V^{2}(X) = \|f_{X,X}(t,s) - f_{X}(t)f_{X}(s)\|^{2}, \qquad (3)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

and the distance correlation between X and Y is

$$R^{2}(X,Y) = \begin{cases} \frac{V^{2}(X,Y)}{\sqrt{V^{2}(X)V^{2}(Y)}}, & V^{2}(X)V^{2}(Y) > 0\\ 0, & V^{2}(X)V^{2}(Y) = 0 \end{cases}$$
(4)

- Preliminaries
 - Distance Correlation

For all distributions with finite first moments, distance correlation R generalizes the idea of correlation in two fundamental ways:

- 1. R(X, Y) is defined for X and Y in arbitrary dimensions,
- 2. R(X, Y) = 0 if and only if X and Y are independent.

Distance correlation satisfies the Rényi postulates A, B, C, D. The rest is partly satisfied. E is satisfied for linear functions, F is satisfied for orthogonal transformations. As for G, if X and Y are bivariate normal, R is a function of ρ .

-Proposed Methods

Proposed Methods

We propose two model selection methods based on the dependence measures distance correlation and maximal correlation.

Stepwise regression using distance correlation

Stepwise regression using maximal correlation

Partial Distance (/Maximal) Correlation

We begin with defining partial distance (/maximal) correlation. Consider random variables X, Y, and a possibly vector valued random variable Z. Given Z, the partial distance (/maximal) correlation between X and Y is computed as follows:

- Regress X on Z, denote the error terms by R_X .
- Regress Y on Z, denote the error terms by R_Y .
- ► The distance (/maximal) correlation between R_X and R_Y is the partial distance correlation between X and Y, given Z.

Stepwise Regression Using Distance (/Maximal) Correlation

Then we can define a stepwise regression procedure, using distance (/maximal) correlation as follows:

- 1. Consider all candidate predictor variables individually and find the one which has the largest distance (/maximal) correlation with the dependent variable.
- 2. For the remaining steps, add one more term such that the partial distance (/maximal) correlation with the dependent variable, given the previously entered variable(s), is largest.
- 3. Stop when all terms have entered the model. The step with the smallest cross-validation error is the selected model.

-Proposed Methods

Illustration on Swiss Fertility Data

Standardized fertility measure and socio-economic indicators for each of 47 French-speaking provinces of Switzerland at about 1888.

- Y Common standardized fertility measure (Fertility)
- ▶ X₁ Percentage of males involved in agriculture as occupation (Agriculture)
- X₂ Percentage of draftees receiving highest mark on army examination (Examination)
- ▶ X₃ Percentage of education beyond primary school for draftees (Education)

- X₄ Percentage of Catholic (Catholic)
- > X_5 Live births who live less than 1 year (Infant Mortality)

Simulation Study

- Cases

Simulation Study

We consider 6 cases.

- Case 1: Linear Relations
- Case 2: Non-Linear Relations
- Case 3: Dependent but Uncorrelated Variables
- Case 4: Constant Collinearity Among Predictors
- Case 5: Toeplitz Collinearity Among Predictors
- Case 6: A Generalized Linear Model: Gamma Regression

For each case we considered N = 100 samples of size n = 100.

Simulation Study

Cases

Case 1: Linear Relations

We consider a total of p = 8 candidate predictors having independent standard normal distributions, q = 3 of which are related with the dependent variable via:

$$Y = X\beta + \epsilon,$$

where $\beta = [1, 1, 1, 0, 0, 0, 0, 0]$ and $\epsilon \sim N(0, \sigma = 2)$.

Simulation Study

Cases

Case 2: Non-Linear Relations

We consider a total of p = 8 candidate predictors from the following distributions: $X_1 \sim N(0,1)$, $X_2 \sim N(0,2)$, $X_3 \sim U(-1.5, 1.5)$, $X_4, ..., X_8 \sim U(-1,1)$. The first q = 4 are related with the dependent variable via:

$$Y = \log[4 + \sin(3X_1) + \sin(X_2) + X_3^2 + X_4 + 0.1\epsilon],$$

where $\epsilon \sim N(0, \sigma = 1)$.

Case 3: Dependent but Uncorrelated Variables

We consider a total of p = 8 candidate predictors from the following distributions: $X_1 \sim N(0, 1.4)$, $X_2 \sim U(-1.7, 1.7)$, $X_3 \sim N(0, 0.8)$, $X_4, ..., X_8 \sim N(0, 1)$. Let us define $Y_1, ..., Y_3$ as follows:

$$Y_1 = |X_1|, \quad Y_2 = X_2^2, \quad Y_3 = X_3^2.$$

It can be shown that the pairs (X_i, Y_i) , i = 1, 2, 3, are uncorrelated. We define the dependent variable as

$$Y = |X_1| + X_2^2 + X_3^2.$$

Case 4: Constant Collinearity Among Predictors

We consider a total of p = 8 candidate predictors from a multivariate normal distribution, $\mathbf{X} \sim N_P(\mathbf{0}, \Sigma)$, where

$$\Sigma = \begin{bmatrix} 1 & \theta & \cdots & \theta \\ \theta & 1 & \cdots & \theta \\ \vdots & \vdots & \ddots & \vdots \\ \theta & \theta & \cdots & 1 \end{bmatrix}$$

We set $\theta = 0.6$. The first q = 3 of these variables are related with the dependent variable via:

$$Y = X\beta + \epsilon,$$

where $\beta = [1, 1, 1, 0, 0, 0, 0, 0]$ and $\epsilon \sim N(0, \sigma = 2)$.

・ロト・西ト・ヨト・ヨー シック

Case 5: Toeplitz Type Collinearity Among Predictors

This is the same as Case 4, but

$$\Sigma = \begin{bmatrix} 1 & \theta & \theta^2 & \cdots & \theta^{p-1} \\ \theta & 1 & \theta & \cdots & \theta^{p-2} \\ \theta^2 & \theta & 1 & \cdots & \theta^{p-3} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \theta^{p-1} & \theta^{p-2} & \theta^{p-3} & \cdots & 1 \end{bmatrix}$$

.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Case 6: A Generalized Linear Model (Gamma Regression)

We consider p = 8 candidate predictors following standard normal distribution, q = 3 of which are related with the response via:

$$L = X\beta,$$

with $\beta = [0.25, 0.25, 0.25, 0, 0, 0, 0, 0]$. The link function is the log function, thus the mean vector of the responses are $\hat{\mu} = e^{L}$. Responses are generated from gamma distribution with mean $\hat{\mu}$ and unit variance
